## APPENDIX G

```
Input:
           A continuous variable x of dimension m \times 1 (note: x cannot be a constant
           variable).
Output:
           The binned x, bx, of dimension m \times 1
Process:
       k is the number of bins
               If m < 1000
                      k = 5
               Else If m \le 10000
                       k = \text{ceil}(5 + 5 * (m - 1000)/9000)
               Else If m \le 100000
                      k = \text{ceil}(10 + 10 * (m - 10000)/90000)
               Else
                       k = 20
               End If
\max v = \max(x)
                      // the maximum value of x
                      // the minimum value of x
minv = min(x)
range = maxv - minv
bx = zeros(m,1)
                      // initialize a vector of dimension m x 1 to zeros
If range > 0
       For i = 1:m
               bx(i) = ceil(k * (x(i) - minv)/range)
               If bx(i) < 1
                       bx(i) = 1
               End If
               If bx(i) > k
                      bx(i) = k
               End If
       End For
End If
```

Return bx.
